For example, proteins, when present in low concentration in their natural sources, are frequently difficult to isolate in a pure form. Likewise, many useful substances are found in extremely low concentration in their natural sources, and, hence, must be isolated from their source in substantially purified form. Another use for the purification of substances is in connection with the generation of derivatives, analogs and analogs of the naturally occurring substance. In such procedures, it is frequently necessary to introduce a substituent into the desired analog which is not present in the original molecule. In certain cases, the substituent is an element, such as a sulfur, an iodine or a phosphorus atom, and in such instances the substituent is generally introduced at a predetermined site, either by deliberate introduction or by means of a reaction which results in the incorporation of the desired element at the desired site. In other cases, it may be desirable to attach to the desired analog an element which is an amino acid or a derivative thereof, such as a peptide, polypeptide, polysaccharide, polypeptide or oligonucleotide. In such cases, it is desirable to do so at a predetermined site. One of the difficulties encountered in connection with the generation of a useful derivative is in the separation of the desired analog from the starting materials. The production of analogs can be quite complicated and extensive, and, in many instances, the purification is necessary before the analog can be used for various purposes. The purification of substances is commonly done using one of the most common techniques, chromatography. In chromatographic techniques, the desired analog is attached to a chromatographic support and then is exposed to a column of another substance which adsorbs to the chromatographic support. The chromatographic support and attached analog are then separated from the remaining materials and the analog is released from the chromatographic support, for example, by eluting it with a solution which
